

MEGA SWEET PACKAGE

Chemical Induction Pump System

The MEGA SWEET (Submersible Wastewater Efficient Effluent Treatment) Package is specifically designed for high capacity chemical feed systems or applications where the suspended solids can get high in the contact chamber.

These packages were originally designed as an alternative to costly problematic induction pump systems which utilize a propeller type design. Systems utilizing a prop type method have been known for frequent failures in the bearings and seals requiring expensive proprietary factory repairs.

The MEGA-SWEET passes process water thru a specifically designed oversized pump and eductor. This creates the necessary vacuum to draw the Chlorination and/or Dechlorination chemicals into the contact chamber.

Consider the Advantages

- **No regular lubrication required**
- **Minimal maintenance**
- **Easy to retrofit**
- **Safe operation—vacuum feed**
- **Easy installation**
- **More efficient chemical use**
- **Lower operating costs**
- **No external water piping**
- **No potable water required**
- **No potable water back flow prevention required**

MEGA-SWEET

The MEGA SWEET provides the most reliable, safe, vacuum chemical delivery feed system. This process involves creating a vacuum via an engineered submersible sewage wastewater pump and venturi. The specifically designed heavy solids handling pump is designed to meet the strict hydraulic requirements of the eductor. The non-clogging sewage pump and eductor will pass up to 1 1/2" solids.
